

My results were:

- Auditory: 35%
- Visual: 30%
- Tactile: 35%

You are an **Auditory/Tactile** learner!

I see myself as mostly a Tactile and Visual learner, so it's interesting that I scored just as high for Auditory as I did for Tactile. I feel like I can't remember how to do something if I am told, I can remember a little better if I am shown, but the only way for me to truly learn something is to be shown how to do it and then do it myself immediately after. This being said, I feel like I can learn pretty effectively through auditory, visual, and tactile, but tactile is how I learn most efficiently! On contrary to the article, I believe learning styles affect how we learn, and that we should pay more attention to our own through implementing specialized learning strategies.
